

Easylube® Intelligent Automatic Lubricator

## Easylube® DC Power Supply Adapter

Stable, Economical, Handy, Eco-friendly

Easylube® P-606S and Easylube® P-606L are made for improving the performance of battery driven power supply. Easylube® DC Power Supply Adapter can be simply put on the driver to replace lithium batteries to provide more stable DC power supply.

The external power switch is designed for equipment that frequently turn on and off. For example, it can adjust the amount of grease for the A and B alternative machines as well as for equipment that does not operate every day or operate less than 12 hours, which can help users achieve saving a significant amount of grease.

DC Power Supply Adapter is capable of working in operating temperature range from -30°C to 80°C, while it is able to provide power in harsh working environment both indoor and outdoor.

Furthermore, DC Power Supply Adapter can completely improve the frequent replacement's problem of lithium battery, which can also save a lot of energy cost as well as reducing waste disposals.

### Easylube® P-606L

DC Power Supply Adapter for 250ml model

### Easylube® P-606S

DC Power Supply Adapter for 60ml / 150ml model

#### Adapter type

Easylube® P-606S

— For 60ml / 150ml model

Easylube® P-606L

— For 250ml model

#### Specifications

Input : DC 10 - 36V  $\overline{\text{---}}$  2A

Output : DC 5.7V  $\overline{\text{---}}$  2A

Power : 12W

Flammability Rating : Main case HB

IP Rating : IP65

Cord Length : 1 meter

#### Installation

1 Remove top cover

2 Put in adapter

3 Tighten firmly

4 Put on dust cover

5 Connect

DC 10 ~ 36 V

IP65 confirmed!

#### Attention

- When connecting this unit to AC power, please make sure the power supply meets the technical requirement of this product.
- After installing this power supply, each time the start switch (ON/OFF) will reset the operation program (RESET), the lubricator will return to zero and re-execute the automatic greasing program (1-360 times).
- After installation, observing the position of piston in the grease cup is necessary in order to make sure to replace with new grease cup when the piston is almost at the bottom of grease cup.
- Before the end of the automatic greasing, the greasing piston will still keep running even it is already at the bottom of the grease cup. It will only stop till the pressure reaches the warning level, which might lead to deformation at the bottom of the grease cup that caused by overpressure.
- After switching to DC adapter, the automatic lubricator will no longer comply with the UL explosion-proof certification specifications. Please make sure that the method of power connection and standard comply with local electrical regulation.
